

HUMAN SPACES REPORT

Global Summary

Key messages

- Biophilic design in the workplace has a strong, measurable impact on key employee outcomes such as well-being, productivity and creativity.
- Those who work in environments with natural elements report a 15% higher level of well-being, a 6% higher level of productivity and a 15% higher level of creativity than those who work in environments devoid of nature.
- Those who enter an office space which incorporates nature are more likely to feel happy and motivated for the day ahead.
- Across the world, a third (33%) of all respondents report that the design of an office would affect their decision to work for that organization, presenting biophilic design as an important consideration for those companies that want to attract and recruit the best employees.
- Existing literature suggests that nature contact has a restorative effect on people, helping them deal with day-to-day stress and work to maintain performance.
- Surprisingly large numbers of employees reported having little or no contact with nature in their workplace – 47% report having no natural light and 58% report having no live plants.
- A number of leading organizations are now providing employees with contact with nature. This latest research presents a further call to action for employers to consider the environments they create and continues the discussion of the importance of biophilia within their workplaces.
